Ho installato ulatencyd ed ho messo in rc.local queste due linee:

```
echo 10 > /sys/devices/system/cpu/cpufreq/ondemand/sampling_down_factor
echo 15 > /sys/devices/system/cpu/cpufreq/ondemand/up_threshold
```

il pc sembra volare :-O

Non ne sono sicuro. In realtà il primo comando serve a far "scendere" meno velocemente la cpu in frequenza quando Ã¨ al massimo mentre il secondo fa sÃ¬ che il procio vada a frequenza massima con un carico inferiore a quello standard, quindi un po' prima. Mi sa che il consumo in idle (che Ã¨ il 90% del tempo) cambi poco.

AspÃ© che guardo...

io ho questo

deb ftp://ftp.es.debian.org/debian/ unstable main contrib non-free

al posto di "es" puoi metterci "it" o "fr"

Stai attento, che non so se fa bene mischiare repos di distro differenti...

allora e' solo per debian!, non avevo capito  
e' meglio che lascio stare, queste modifiche di solito  
finiscono per farmi formattare tutto, e questo non e' il momento :)

grazie

Ma no... Nemmeno devi essere cosÃ¬ drastico. Comunque apt-get t'avvisa se fai qualche cazzata e fai sempre in tempo a fermare tutto. Se vuoi ne riparlamo stasera, che adesso devo andare.
